Hidenobu Watanabe, Jeremy R. Jass, LESLIE SOBIN

This classification is based primarily on the microscopic characteristics of tumours. It is therefore concerned with the identification of cell types and histological patterns as seen by conventional light microscopy. In general, time-honoured terms have been retained. Synonyms are listed only if they have been widely used, or if they are considered to be important for understanding the disease process. In such cases the preferred term is given first, followed by the synonym in parentheses. The individuality of the tumour manifests itself principally in its histological appearance and the extent of spread at the time of diagnosis. This volume is concerned only with the histological classification of tumours. Anatomical extent or staging is covered in the TNM 1 Classification. The histological classification of a tumour depends on two main parameters, typing and grading, and a number of additional parameters which may apply to selected examples.
